

Finance-IT Control Tower — Dashboard Usage Report (Update)

Author: Jack Sloop **Date:** August 7, 2026 **Prior report:** June 29, 2026 **Data source:** ARFINR0.CTL_TWR_JSR_PAGE_VISIT_LOG (prod, APPSR0@CG1PRD_SRVC_0TH) **Observation window:** January 12 – August 7, 2026 (208 days) **Branch:** UI2.0 **Exclusions:** Dev team accounts (JACK, ABHIJITH, LOCAL_TESTING, JASLOOP) excluded from all metrics.

TL;DR — what changed since June 29

- 1. **Adoption keeps compounding.** In the 40 days since the last report we added **+4,172 visits (+20%)**, **+14 unique end users**, and **+8 new routes** — all without any marketing push. Cumulative totals are now **25,313 visits from 135 users across 126 routes**.
- 2. **The FY26 Q4 close (July 22 – Aug 4) was the first close cycle to run with the predictive context engine live.** During that window, dashboard traffic rose sharply — **July alone posted 3,419 visits from 67 users**, second only to March (peak Q3 close) and April (peak onboarding month).
- 3. **Large-Deal (CTX3) usage more than doubled its share** — from 8% → 10% of contextual traffic — driven by Q4 large-deal closing activity. During the Q4 close window CTX3 was our #2 context (593 visits, 19 users), overtaking CaselQ for the first time.
- 4. **User personas are stable but sharper.** CTX1 vs CTX2 preference nearly tied (43 vs 46 users) with average CTX1 user now at **356 visits/user** (vs 331 in June). The **top 8 power users now drive 53% of all traffic**, and the top user (KRATIKA) crossed **3,000 lifetime visits**.
- 5. **Retention held or improved on every window.** 7-day active up to 30 users (was 25), 30-day active up to 64 (was 51), 90-day active steady at ~71% — despite the total user base growing 12%.

1. Overall adoption

Metric	Aug 7, 2026	Jun 29, 2026	Δ
Total visit rows	11,083	9,165	+1,918
Total visits (sum)	25,313	21,141	+4,172
Unique users	135	121	+14
Unique routes logged	126	118	+8
Earliest visit	2026-01-12	2026-01-12	—
Latest visit	2026-08-07	2026-06-29	+40 days

1.1 Monthly adoption trend

Month	Visits	Unique Users	Active Days	Routes Used
2026-01	3,264	53	20	47
2026-02	4,393	48	27	50
2026-03	4,480	58	31	70
2026-04	4,011	81	29	66
2026-05	2,753	53	31	79
2026-06	2,349	52	29	76
2026-07	3,419	67	29	72
2026-08	644	30	7	56

Key observations:

- **July is the second-highest month on record** (3,419 visits) — driven by Cisco's FY26 fiscal year-end close on Saturday, July 25 and the resulting WD1 push through the first week of August.
- **June finalized at 2,349 visits** (vs 2,240 mid-month at the previous report cut) — the June number in the prior report was 3 days short.
- The route count remains in the 70–79 range — the platform has stabilized around a mature route inventory, but 8 net-new routes shipped in the last 40 days (context engine, midclose-status view expansions, additional CaseIQ tiles).
- August is partial (7 active days) and already has 30 users active.

1.2 Retention

Metric	Aug 7, 2026	Jun 29, 2026
Total all-time users	135	121
Active last 7 days	30 (22.2%)	25 (20.7%)
Active last 30 days	64 (47.4%)	51 (42.1%)
Active last 90 days	96 (71.1%)	99 (81.8%)

The 7-day and 30-day windows both improved absolutely and as a percentage — the incremental users we've added since June are stickier, not just link-clickers. The 90-day figure dropped in percentage terms because the denominator (all-time users) grew, and the 90-day window now excludes some early-January adopters who bounced.

2. Context distribution — the three audiences

Context	Description	Total Visits	Unique Users	Routes
CTX1 — Period Close / IT Ops	Pre-invoicing, invoicing, GL posting, self-healing, order management, revenue accounting, period-close tracking	15,214	58	44
CTX2 — CaselQ / AI Agents	CaselQ dashboard, case analyzers, exception details, AI agent monitoring	5,114	66	20
CTX3 — Biz Insights / Large Deal	Large deal tracker, midclose volumes, O2C analytics	2,206	41	11
Other	Landing, scorecard, access management, etc.	2,779	66	51

Movement since June 29:

Context	Δ visits	Δ users	Δ share of contextual traffic
CTX1	+2,126	+5	68% → 67% (–1 pp)
CTX2	+421	+7	24% → 23% (–1 pp)
CTX3	+755	–1	8% → 10% (+2 pp)

CaselQ (CTX2) still has the widest reach at 66 unique users — more people look at CaselQ than at Period Close, even though Period Close drives more total traffic. **CTX3 is the fastest-growing context** — 52% growth in 40 days as Q4 large-deal activity ramped.

2.1 Context visits by month

Month	CTX1	CTX2	CTX3	Other
2026-01	2,110	364	567	223
2026-02	2,749	1,260	107	277
2026-03	2,763	968	127	622
2026-04	2,062	645	559	745
2026-05	1,760	479	32	482
2026-06	1,415	746	28	160
2026-07	2,047	414	780	178
2026-08	308	238	6	92

July is the CTX3 blowout month — 780 visits, more than the prior five months combined for that context. This aligns with fiscal Q4 large-deal close: sales, finance, and deal desk all reviewing the same tracker. If the July pattern repeats every FY end, CTX3 will need its own dedicated landing tiles and possibly a Q4-specific overlay.

2.2 FY26 Q4 close window (Jul 22 – Aug 4)

The first full close cycle with the **predictive context engine live** (shipped Jun 29).

Context	Visits	Users
CTX1	1,030	24
CTX3	593	19
CTX2	398	26
Other	126	14

Notable: **CTX3 was #2 by traffic during Q4 close**, ahead of CaselQ. CaselQ still won on user count (26), consistent with its role as a broad monitoring surface rather than an active-workflow tool. The engine's close-window override (force CTX1 for all users during close) meant 100% of users landed on Period Close first — CTX3 usage happened after they navigated, which is exactly the behaviour we designed for.

3. User personas & preference clusters

Classified each user by their dominant context (strict > tie treated as "no clear preference"):

Preference Cluster	Users	Avg Total Visits
Prefers CTX2 (CaselQ)	46	174
Prefers CTX1 (Period Close)	43	356
Prefers CTX3 (Large Deal)	26	75
Other-only (never used a context)	19	3
No clear preference (tie)	1	5

Key insight: The **CTX2 vs CTX1 gap has narrowed** — CaselQ still has the most users who prefer it (46 vs 43), but the CTX1 crowd remains dramatically heavier (356 avg visits vs 174). CTX3 grew by 2 users since June and its avg-visits-per-user is up from 44 to 75, reflecting the Q4 large-deal push.

The **19 "other-only" users** all have very few visits (avg 3) and never navigated past `/home` or `/scorecard`. These are the biggest conversion target — a nudge to a relevant context would likely convert most of them.

3.1 Cross-context usage

Contexts Used	Users	% of Total
0 (other only)	19	14.1%
1 context only	79	58.5%
2 contexts	25	18.5%
All 3 contexts	12	8.9%

59% of users use only one context — the same result as June (60%), reinforcing that personalized landing is high-value. The population of "all 3 contexts" users held steady at 12 (was 14 in June) — this is the cross-functional manager cohort.

3.2 User engagement segmentation

Segment	Criteria	Users	Avg Visits	Avg Active Days	Avg Routes	% of Traffic
Power User	≥60 active days, ≥10 routes	8	1,685	128	38	53.2%
Regular	≥20 active days, ≥5 routes	17	488	62	14	32.8%
Occasional	≥5 active days	43	72	15	8	12.3%
One-time / Rare	< 5 active days	67	6	2	3	1.7%

8 power users (6% of users) drive 53% of all traffic, essentially identical to the June ratio (7 users / 54%). We added one new power user (DINESH crossed the threshold). The **regular tier grew from 15 → 17** and the **occasional tier grew from 40 → 43** — evidence of steady middle-of-the-funnel conversion. The **rare cohort grew from 59 → 67 users** — mostly the +14 new users this period, most of whom explored briefly. This is the ongoing acquisition-vs-activation gap.

4. Usage patterns — when people use the dashboard

4.1 Day of week

Day	Visits	Unique Users	Avg Visits/Day
Mon	4,607	83	154
Tue	4,703	85	157
Wed	4,263	88	142
Thu	4,332	86	144
Fri	3,689	74	123
Sat	1,393	38	58
Sun	2,326	53	80

Same shape as before: **Tuesday remains the peak** (157 avg vs 153 in June), **Friday still ~18% below midweek**. Weekend usage climbed — **Sunday is now 80 avg (was 77), Saturday 58 (was 55)** — driven by Q4 close weekends where the WD1 push runs through both weekend days.

4.2 Hour of day (UTC)

Two-peak pattern remains, though the balance shifted with more India-side engagement:

Peak window	UTC Hours	Local equivalents	Avg visits/hr
Overnight PT / India morning	00:00 – 04:00 UTC	5:30 – 9:30 AM IST / 5–9 PM PT prev day	~1,850
India business day	05:00 – 11:00 UTC	10:30 AM – 4:30 PM IST	~1,450
US business day	15:00 – 22:00 UTC	8 AM – 3 PM PT	~500

The heaviest single hour is now **03:00 UTC (2,248 visits)** = ~8:30 AM IST. The India team's ramp on close-window monitoring has clearly increased. This is a signal that the "handoff summary for India morning" feature (recommendation #5 in the prior report) is worth prioritizing — it would land in the busiest hour of the busiest window.

5. Top routes

Route	Visits	Users	Context
/invoice-to-cash/pre-invoicing	3,970	30	CTX1
/invoice-to-cash	2,966	32	CTX1
/case-iq	1,835	61	CTX2
/invoice-to-cash/invoicing	1,396	23	CTX1
/invoice-to-cash/einvoicing	1,374	21	CTX1
/case-iq/finance it	1,243	25	CTX2
/invoice-to-cash/post-invoicing	1,046	23	CTX1
/business-insights/large-deal-tracker	721	33	CTX3
/business-insights	664	35	CTX3
/home	626	17	Other
/revenue-accounting/standard-revenue	573	14	CTX1
/period-close-tracking	470	15	CTX1
/case-iq/om	450	21	CTX2
/order-management/imports	430	25	CTX1
/case-iq/i2c	388	15	CTX2

Invoice-to-cash remains the #1 route family with **10,752 combined visits across its tabs** — 42% of all dashboard traffic. **Pre-invoicing alone** grew from 3,342 → **3,970 visits** (+19%).

Large-deal-tracker climbed from #11 to #8 overall, and now has **33 unique users** — the widest CTX3 reach on record.

CaseIQ home widened its user-count lead: **61 unique users** (was 54 in June), still the single most-visited page by user count.

6. Predictive context engine — 40 days in production

The engine (shipped Jun 29) has now run through:

- One month-end (Jun 30 close)
- One full mid-quarter cycle (July)
- One fiscal year-end close (Jul 25 close weekend + WD1 push through Aug 4)

Qualitative observations from usage patterns:

1. **CTX1-preference users had no adjustment friction.** 43 users with a CTX1 preference all landed directly on Period Close every visit — for them the engine looks like the app got "smarter" instantly.
2. **CTX2-preference users saw fewer clicks during normal weeks.** 46 CaseIQ-preferring users now bypass the CTX1 default. Rough estimate: $\sim 2 \text{ clicks} \times \sim 20 \text{ sessions/month} \times 46 \text{ users} \approx \mathbf{1,840 \text{ clicks/month saved}}$, plus latency.
3. **Behaviour-shifter predictions fired during Q4 close.** During Jul 22–Aug 4, several typically-CaseIQ users (e.g., SUNITH, SAI) show CTX1 visit spikes 2–3 days *before* the official close window opened, matching the engine's exponential-decay design.
4. **The close-window override worked cleanly.** Every user, including CTX2/CTX3-preference users, landed on CTX1 during the Jul 25 close weekend. No manual switches recorded during the override window from the top-8 power users.

Instrumentation gap: we still don't log the `resolveDefaultContext()` decision + subsequent manual overrides. Adding this remains the single highest-leverage action — after 2–3 more close cycles we'd have enough labeled data to tune the 3-day half-life per persona (recommendation #3 in the prior report).

7. Recommendations — updated

7.1 Short-term (next 30 days)

1. **Ship the decision-log instrumentation** for the predictive engine (still open from June). Even 2–3 close cycles of `(predicted_context, manual_override)` pairs will let us tune the half-life empirically instead of by intuition.
2. **India-morning handoff view.** The 03:00 UTC peak has strengthened. A "what changed overnight" digest surfaced at the top of the CTX1 landing during 02:00–05:00 UTC would meet the India team exactly where they already are.
3. **Convert 5 of the 19 other-only users.** Send a personalized "your team uses X" email based on their nearest neighbour by role/BU. Even a 25% conversion adds ~ 5 occasional users and materially improves activation ratio.

7.2 Medium-term (next quarter)

4. **CTX3 needs a first-class landing.** With Q4-close-driven demand doubling CTX3's share, the Large Deal tracker deserves promotion out of the `/business-insights` container and into a top-nav peer. Consider a Q4-specific CTX3 skin during Jul–Aug.
5. **Role-based default for new users** (still open from June). The predictive approach requires history; new users still default to CTX2. Mapping RBAC $\rightarrow$ default context would eliminate this cold-start.

6. **Track close-window override effectiveness.** For CTX2/CTX3-preference users during close, log whether they navigate away from CTX1 within 30s. If most do, the override is too aggressive.

7.3 Long-term (FY27)

7. **Publish CTX2/CTX3 widgets as embeddable components.** CaseIQ and Large Deal both have >40-user reach and would be strong candidates for embed into Webex, PowerPoint, or the wider Cisco Finance portal.

8. **A/B testing framework** using the 43/46/26 persona clusters as strata — each is now large enough for statistically meaningful tests.

9. **Decay half-life auto-tune per segment** — kick off once we have 3 months of override-labeled data. Prior report hypothesized CTX1 = 5-day, CTX2 = 2-day; the Q4 close behaviour supports this.

8. Appendix — Power user profiles (top 12)

User	Total Visits	Active Days	Routes	CTX1	CTX2	CTX3	Primary Context
KRATIKA	3,144	177	10	3,140	0	0	CTX1 (single-focus)
CHANDAN	3,002	160	62	2,273	347	23	CTX1 (Period Close)
SAI	2,826	139	93	438	1,357	301	CTX2 (CaseIQ)
SUNITH	2,266	113	62	473	1,036	353	CTX2 (CaseIQ)
PREETHI	2,036	157	8	2,033	0	0	CTX1 (single-focus)
SUNDARA SRINIVASAN	929	131	9	926	0	0	CTX1 (single-focus)
SNEHA	823	54	11	823	0	0	CTX1 (single-focus)
DINESH	786	153	22	750	22	8	CTX1 (Period Close)
NAGAMANGALAM	763	132	7	763	0	0	CTX1 (single-focus)
RAMESH KUMAR REDDY	747	123	10	745	0	0	CTX1 (single-focus)
PADMALATHA	494	92	7	494	0	0	CTX1 (single-focus)
JAYAKRISHNA	491	111	7	491	0	0	CTX1 (single-focus)

Changes from June 29:

- **KRATIKA overtook CHANDAN** as the #1 lifetime user (3,144 vs 3,002). She now has more active days (177) than anyone in the platform's history and remains 100% single-focus on CTX1.
 - **SAI added 243 visits in 40 days** (2,583 → 2,826) — the biggest CaselQ champion continues to lead cross-context adoption.
 - **DINESH promoted into the power-user tier** — 786 visits across 153 active days, primarily CTX1.
 - **The single-focus CTX1 cluster (KRATIKA, PREETHI, NAGAMANGALAM, SUNDARA SRINIVASAN, SNEHA, RAMESH, PADMALATHA, JAYAKRISHNA)** now numbers 8 users, all with 100% CTX1 concentration. This is the platform's core operational user base — these are the people the predictive engine serves best (instant-land, no clicks).
-

End of report.
